

**U.S. Department of the Interior
Bureau of Land Management**

Geologist

Make a Career of It!

If a job that mixes the past with the present sounds interesting, then working as a Bureau of Land Management (BLM) geologist could be the choice for you. BLM geologists study the processes that shaped the public lands long ago, and which continue to shape them today.

Geologists who work for the BLM use their knowledge to facilitate the extraction of minerals, such as oil and gas, by identifying prospective reserves and ensuring that environmental policy is followed during exploration and development. Geologists who don't work in the area of mineral development might work with fossils or in environmental/ engineering geology, the study of how geologic features affect the construction and stability of structures such as bridges.
