

Visitors from the South

Have you seen our hidden visitor from the South?

If you look very carefully in the shrubs along the Table Rocks trails you might see a tiny pair of eyes watching you.

Blue-gray Gnatcatcher

The Blue-gray Gnatcatcher is a small, active bird who loves to eat gnats and flies.

They lay 4-5 pale blue eggs with brown spots in a small cup nest made of plant material, lichen, and spider webs.

Gnatcatcher's Range in the United States

Oregon

Gnatcatcher's Range

What do they look like ?

The Blue-gray Gnatcatcher is smaller than a sparrow with a slender, long tail. It is gray above, white below, and has a white eye ring around its eye.

The Table Rocks are the farthest north in the western United States that this bird travels!

All of the animals live together in harmony on the Table Rocks. Remember, you are a visitor in their home. Please be a considerate guest!
